Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

cc useful for regulating an endogenous protein affecting ErbB-4 receptor cc activity in vivo. They are also useful for treating or preventing a disease condition or syndrome associated with disregulation of an endogenous protein affecting ErbB-4 receptor activity, e.g., amyotrophic cc lateral solerosis (Lou Gehrig's disease), Bell's palsy, spinal muscular disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's crome, nerve deafness, neuropathy, muscular dystrophy, extramamary cc syndrome, nerve deafness, neuropathy, muscular dystrophy, extramamary cancer, cervical carcinoma, endometrial adenocarcinoma, pencreatic of another contraction and Zollinger-Ellison syndrome. The agent comprised in the pharmaceutical composition includes a polypeptide (e.g., a soluble colling of an individed colling of an immunoreactive derivative of an enceptor activity. Traceable synthetic/recombinant RRG-4-tagged molecules compassined. Sequences AdG66044-53 represent the EGF-like motifs of various

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                               This is a peptide derived from mouse epidermal growth factor (EGF) composition to target laminin receptors. EGF derived peptides inhibit blood vessel formation through their antagonism of the high affinity 67bd laminin receptor found on endothelial cells. The peptide is modified in the natural sequence to prevent protease attack. The peptide is wedd in the preparation of a medicament for binding to laminin receptors as an wounds and treating anglogenic diseases, especially retinopathy of ammaturity. Other diseases treated include metastatic cancer, trichomonas vaginalis. The peptide is used family and parasitic infestations like leishmania and training the peptide is used and the state of the peptide is an endiance of include metastatic cancer, trichomonas vaginalis. The peptide are anti-anglogenic in human models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel ErbB-4 ligand, neuregulin-4 (NRG-4). NRG-4 binds to mammalian ErbB-4 receptor and can be expressed by standard recombinant methodology. Pharmaceutical compositions comprising NRG-4 are

                                                                                                                                                                                                                                                                                                                                                                                                                                                      The amino acid sequence is that of an epidermal growth factor tripentacontapeptide which is synthesised by condensation of protected smaller peptide sequences. This method produces the peptide smoothly, with high purity and yield.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                            The inventors claim synthetic peptides which correspond to sequences occurring in EGF but excluding EGF. The synthetic peptides correspond to active sequences from EGF fragments: 3-14, 12-14, 12-15, 3-10, 29-37 and 33-37 (Claims 2-7 and AAP91659-P91664 resp.). The peptides are anglogenic. Their relative shortness means that they pose fewer synthesis problems than the entire EGF molecule.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The human rEGF is used to treat oversecretion of gastric acid or epithelial wound. EGF is modified to increase its chemical stability. Its storage life is improved without diminishing its biological activity. The proteins may be prepared by traditional chemical or recombinant means.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human epidermal growth factor \cdot is substituted at position 11 for greater stability and improved storage life.

```
This is a chimeric epidermal growth factor (EGF) protein AC. This coineric EGF protein contains sequences derived from human and mouse EGF sequences. The chimeric EGF proteins can be recombinantly produced by culturing a microorganism of the genus Bacillus transformed by an expression vector containing the encoding DNA molecules. The recombinant chimeric EGF proteins exhibit a wide variety of physiological activities similar to those of naturally occurring EGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Epidermal growth factor; EGF; chimeric; human; mouse; recombinant.

                                                                                                                                                                                                                                                 The sequences given in AAR67273-76 are cell growth factors which may be used in the viscoelastic solution of the invention. The peptides are derived from fibroblastic growth factor (FGF) and epidermal growth factor (FGF). The viscoelastic solution also comprises a buffered solution which is pref. a buffered balanced salt solution, at least 1 of hydroxy or carboxypropyl methylcellulose, a cellulose gum, dextran or dextran sulphate, chondroitin sulphate, and soldum hyaluronate. It has a pH of 6-8 and an osmolarity of 200-400 mOSmol/1. The growth factors are mitogenic in vitro for a wide range of tissues and the viscoelastic soln. may be used as a surgical soln. which is in direct contact with cells undergoing wound healing. It also provides a cell protection and cell coating during surgery. The soln. provides maintenance of tissue space, hydroxypropyl methylcellulose and chondroitin sulphate lubricate the tissue, while sodium hyaluronate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents mouse epidermal growth factor (EGF)

from the present invention. The present invention describes a method for

the isolation of recombinant epidermal growth factor (EGF) from whole

broth. The method comprises: (a) passing a culture containing the

crotein upwards through a column containing a fluidised bed of ion

schanger, washing the ion exchanger to remove non-adsorbed material,

allowing the ion exchanger to settle, and eluting adsorbed material,

callowing the ion exchanger to settle, and eluting adsorbed protein by

passing an eluant downwards through the column; (b) filtering the eluate

through a membrane with a molecular weight cutoff of 10000, and (c)

concentrating the filtrate on a membrane with a molecular weight cutoff

of 5000. The method is for isolating recombinant human, mouse, pig or

cat EGF, or an EGF analogue with one of four defined amino acid sequences

(given in the specification), from Bacillus brevis cultures. The EGF

proteins can be recovered in high yield and high purity without the need

to pretreat the culture broth to remove the cells, e.g. by costly
                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                             chimeric ECF protein contains sequences derived from human and mouse EGF sequences. The chimeric EGF proteins can be recombinantly produced by culturing a microorganism of the genus Bacillus transformed by an expression vector containing the encoding DNA molecules. The recombinant chimeric EGF proteins exhibit a wide variety of physiological activities similar to those of naturally occurring EGF.

```
The present sequence represents a protein which has epidermal growth factor (EGF) like activity, from the present invention. The present invention of recombinant epidermal growth factor (EGF) from whole broth. The method comprises: (a) passing a culture containing the protein upwards through a column containing a culture containing the protein upwards through a column containing a disorbed material, allowing the ion exchanger to settle, and eluting adsorbed protein by passing an eluant downwards through the column; (b) filtering the eluate through a membrane with a molecular weight cutoff of 1000, and (c) concentrating the filtrate on a membrane with a molecular weight cutoff of 5000. The method is for isolating recombinant human, mouse, pig or rat EGF, or an EGF analogue with one of four defined amino acid sequences (given in the specification), from Bacillus brevis cultures. The EGF proteins can be recovered in high yield and high purity without the need to pretreat the culture broth to remove the cells, e.g. by costly centrifugation or membrane filtration.

```
The present sequence represents a protein which has epidermal growth factor (EGF) like activity, from the present invention. The present invention describes a method for the isolation of recombinant epidermal growth factor (EGF) from whole broth. The method comprises: (a) passing coulture containing the protein upwards through a column containing a disorbed material, allowing the ion exchanger to settle, and eluting a disorbed protein by passing a telunat downwards through the column; (b) of illering the eluter through a membrane with a molecular weight cutoff of 5000. The method is for isolating recombinant contains mouses, pig or rat EGF, or an EGF analogue with one of four chiman, mouses, pig or rat EGF, or an EGF analogue with one of four defined amino acid sequences (given in the specification), from Bacillus containty without the need to pretreat the culture broth to remove the very cells, e.g. by costly centrifugation or membrane filtration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps

In present inventions useraces to non-natural variants of a C-TERMINAL non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic one third antibody that inhibits the proteolytic cone third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2, and has the same affinity for at least MSP-1_4_2, compared to natural MSP-1_1_9. The non-natural variants of and can be used to treat malaria. The present invention are useful for immunising a mammal against malaria, epidermal growth factor (EGF). This sequence was used in a sequence (see ABB37608), which was used to generate the variants of the present invention.

The invention describes a method of forming (M1) chimeric polynucleotides (I). The method comprises contacting a population of polynucleotides (I). The method comprises contacting a population of a single-stranded scaffold fragments (SF) with population of donor fragments (DF) to form a complex (II) comprising at least one SF hybridised to two DFs. (II) is treated so that single stranded regions of (II) are filled in and adjacent fragments are ligated. (M1) is useful for a directed evolution process which involves forming a library of (I) that can be screened for a characteristic of interest. Subsequent rounds of directed evolution can produce chimaric polynucleotides with an improved characteristic of interest. The methods facilitate the generation of chimeric polynucleotides and do not require hybridising conor fragments to a target or full-length template. Because the chimeragenesis process does not rely upon a contiguous, full-length template, it is unnecessary to modify a template to facilitate its removal. This is the amino acid sequence of the mouse epidermal growth factor (EGF) used to demonstrate a method of in vitro recombination
                                                                                                                                                                                                                                                                                                                   Forming chimeric polynucleotide by contacting single-stranded (ss) scaffold fragment, and donor fragment populations to form hybridised complex having ss regions which are filled-in, and ligating adjacent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mouse; epidermal growth factor; receptor; EGF; chimeric polynucleotide; directed evolution; chimeragenesis; recombination.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a humanised form of the antibody 340 (a mouse monoclonal antibody which binds to epidermal growth factor (EGF) receptor and inhibits binding of EGF), obtainable from the cell line deposited with the ECACC under accession number 97021428. The humanised form of the antibody 340 is useful in gene therapy, medicine and in the manifacture of a medicament for treatment or prophylaxis of cancer. The invention is useful for treatment or prophylaxis of cancer after ovarian cancers or also for preventing the recurrence of cancer after initial treatment or surgery. The invention is also useful for enhancing a protective immune response against cancer by optimised immunisation schedules. The humanised form of the antibody 340 has reduced immune response against colls expressing EGF creceptor, as the original murine antibody and has increased ability to inhibit the growth of EGF receptor expressing cells. The invention is used as cell growth and apoptosis inhibitor. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                    New humanized form of mouse monoclonal antibody 340 which binds to epidermal growth factor receptor and inhibits binding of growth factor, useful for treating colorectal, lung, breast, gastric and ovarian

; Sequence 2, Application US/08284923
; Patent No. 554795
; GENERAL INFORMATION:
APPLICANT: Mullenbach, Guy T
APPLICANT: Blaney, Jeffrey M
APPLICANT: Blaney, Jeffrey M
APPLICANT: Muteins of Epidermal Growth Factor
TITLE OF INVENTION: Muteins of Epidermal Growth Factor
TITLE OF INVENTION: Exhibiting enhanced binding at low ph

Title:

US-09-673-785D-8

Sequence:
1 CVIGXSCDRC 10

Scoring table: BLOSUM62DX
Gapop 10.0, Gapext 0.5

Searched:
440863 seqs, 114992915 residues

Total number of hits satisfying chosen parameters:
440863

Minimum DB seq length: 0

Maximum Abs seq length: 2000000000

Maximum Match 100%
Listing first 45 summaries
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 35, Application US/10150648B
Publication No. US20030059802Al
GENERAL INFORMATION
APPLICANT: Bilodeau-Goesseels, Sylvie
APPLICANT: John, Sushil J.
APPLICANT: Selinger, Leonard B.
APPLICANT: Selinger, Leonard B.
TITLE OF INVENTION: Mucleic acid and protein sequences of bovine epidermal growth
TITLE OF INVENTION: factor
TITLE OF INVENTION: factor
CURRENT APPLICATION NUMBER: US/10/150,648B
CURRENT APPLICATION NUMBER: 60/292,136
PRIOR APPLICATION NUMBER: 60/292,136
PRIOR FILLING DATE: 2001-05-18

A;Title: Cloning and Sequencing of the Rat Preproepidermal Growth Factor CDNA: Comparisc
A;Reference number: 152995; MUID:92398779; PMID:1524680
                                                  A. Experimental source: PC-12 cell
C. Comment: This protein is a member of the epidermal growth factor family. It is functic ating the differentiation of MDA-MB-453 cells.
C. Superfamily: human ErbB kinase activator alpha, brain and thymus; EGF homology
F.1-25/Domain: EGF homology (fragment) < EGF>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    <SIM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A,Molecule type: mRNA

        FUNCTION: Ligand for multiple Notch receptors and involved in the mediation of Notch signaling (By similarity). Seems to be involved in cell-fate decisions.
SUBCELLULAR LOCATION: Type I membrane protein (By similarity).
SIMILARITY: CONTAINS 17 EGF-LIKE DOMAINS.
SIMILARITY: CONTAINS 1 DSL DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EXTRACELLULAR (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           POTENTIAL.

               signaling during nervous system formation.

Signaling during nervous system formation.

SIGNELLIAR LOCATION: Integral membrane protein.

SIGNELLIAR LOCATION: Integral membrane protein the developing CNS, expression is uniform along the rostrocaudal axis. During gastrulation, it is expressed within the anterior neural ectoderm. At E10, expression is strong in the ventricular zones (WZ) in all sectors of the brain, and lower in the marginal zones (WZ) in all sectors of the brain, and lower in the marginal zones (WZ) in all sectors of the brain, and lower in the marginal zones (WZ).

Sectors of the brain, and lower in the marginal zones (WZ) in all sectors of the brain, and lower in the cerebral with the present in the brain. It is strong in VZ, lower in MZ, except in the cerebral with the ferenciating fields than in VZ, except in the cerebral hemispheres, and to a lesser extent in the tectum and cerebral hemispheres, and to a lesser extent in the fetal lungs, kidney and epithelial in the newborn and postruatal stages, expression remains restricted to the VZ as well as in migrating and postmigratory cells throughout the brain.

SIMILARITY: CONTAINS 9 CADHERIN DOMAINS.

SIMILARITY: CONTAINS 9 EGF-LIKE DOMAINS.

SIMILARITY: CONTAINS 1 LAMININ G-LIKE DOMAINS.

SIMILARITY: CONTAINS 1 GAS DOMAIN.

MEDLINE=21374376; PubMed=11459941;
Tonservation of the biochemical mechanisms of signal transduction among mammalian Notch family members.";
Proc. Natl. Acad. Sci. U.S.A. 98:9026-9031(2001).
I. FONCTION: Functions as a receptor for membrane-bound ligands agged1, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.
Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in specification and/or differentiation.

Specification and/or differentiation.

C. SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DEVELOPMENTAL STAGE, AND ALTERNATIVE SPLICING.
